

**IN THE ABSTRACT:**

Please amend the Abstract as follows:

~~The present invention relates to a~~ A robot apparatus, an information processing method  
and a program therefore ~~are~~ capable of notifying a user of the state of communication with an  
access point, ~~an information processing method and a program therefor.~~ A humanoid robot 5,  
which independently determines an action in accordance with an instruction from a user or a  
surrounding environment, communicates with an access point 2 based on IEEE 802.11b. For  
example, the robot 5 controls a household electrical appliance 4-1 through a network 3 and  
receives a command from a personal computer 4-2 over the network 3 to execute a  
predetermined process. The robot 5 measures the quality of communication with the access point  
2 at regular intervals. When the communication quality of a predetermined level or lower is  
continued for a predetermined period, the robot 5 generates speech, e.g., "I cannot see the access  
point. What should I do?" and waits for an instruction from the user. When receiving an  
instruction from the user, the robot 5 takes an action according to the instruction.
